

SENTRA
ARTIFICIAL INTELLIGENCE

CLINICAL INTELLIGENCE FOR FRONTLINE CARE

Sentra Artificial Intelligence is an Indonesian healthcare technology company developing clinical decision support and real-time disease-trajectory intelligence for resource-constrained care. Our systems sit above existing workflows - interpreting unstructured notes, detecting risk patterns, and converting frontline data into decision-ready signals without replacing the clinician or the EMR.

WHAT WE BUILD

Sentra Assist / AADI is an augmentative clinical-intelligence layer for diagnostic support, deterioration-risk detection, medication safety, structured documentation, and referral support. It is designed for FHIR R4 interoperability and Indonesia's SATUSEHAT ecosystem.

WHY IT MATTERS

Across Indonesia, 2,800+ hospitals and 10,000+ clinics operate with limited digital infrastructure and scarce specialist coverage. In frontline maternity and primary care, small delays in recognizing deterioration can become preventable harm.

PROPRIETARY CLINICAL INTELLIGENCE

FTDR / FORWARD TRANSITION DETERIORATION RISK

Probabilistic model for predicting maternal deterioration across clinical encounters, supporting earlier intervention before conventional thresholds are breached.

C-STD / STRUCTURED CLINICAL REASONING

Clinical-language NLP framework for Indonesian medical documentation, translating noisy frontline notes into standardized ICD-10 representations and decision-ready signals.

CLINICAL GOVERNANCE

AI acts as a copilot. Licensed health professionals retain final clinical authority and accountability.
